display control unit 107 makes the combined image data display onto the LCD 11. The operational instruction inputting section 103 designates the image data in enlarged or reduced manner. In response to this designation, the  
5 image data processing unit 106 combines a plurality of image data to store the combined one onto the memory card 10 and make the display control unit 107 display the combined image onto the LCD 11.

Fig.3 is for explaining how the digital camera of the  
10 first embodiment combines two image data and stores the image data. Operation for combining and storing two image data will be explained based on Fig. 1, Fig. 2 and Fig. 3.

The image display memory 19 includes many logical planes P1, P2, and P3. The image display control circuit  
15 18 can display an image by overlapping these planes P1, P2, and P3. The image display control circuit 18 executes control of information such as the position to be display, magnification, luminosity, and a transparency distribution by each of planes P1, P2, and P3 when overlapping them.

20 Image information from object through lens 1 is converted to an electric signal (analog image data) by the CCD 3. Thereafter, the converted signal is supplied to the AD converter 5 by way of the CDS circuit 4. Thus, the analog image data is converted to digital image data with this AD  
25 converter 5.
